

KEY TAKEAWAYS

Global Sustainability Challenges: Part 1

Dr Jane Goodall provided her expert insight on the major sustainability challenges of our time, highlighting their complexity and interconnected nature.

1. Existential threats like climate change and biodiversity loss are exacerbated by industrial systems inherent in modern agriculture, fishing, and the production of goods.
2. Countries need to address corruption and bottom-up issues like overconsumption. Without effective management of these challenges, improving our industrial systems will be extremely difficult.
3. Sustainability challenges may be global, but they do not impact everyone equally. For this reason, it is important to address issues like poverty in tandem with environmental protection measures.
